

Important Information

Cell classifications determined by MOST RECENT catch

Numbers inside of a cell indicate the cumulative number of tows within the cell

Only catches with high or moderate amounts of river herring and/or shad outside of grids are shown with location determined by best estimate using tow locations

All catches within grids are displayed

A single tow may occur in several cells

The HIGH bycatch threshold reflects a rate at which river herring and shad catch limits will be reached before Atlantic herring catch limits.

- Low (less than 0.3% River Herring and Shad bycatch)
- Moderate (between 0.3% and 1%)
- High (above 1%)

Last Update: 12/11/2017
Vessel Samples: 13

Note: Vessels generally make paired tows
